Quenby Hall Dairy Ltd chose JWCI Ltd for major expansion work including custom design, manufacture and installation of equipment and ongoing after sales service.

INSET: Original installation for Quenby Hall Dairy by JWCI.
ABOVE: To increase production a further four vats were installed in phase two.

When one of the finest 'Stilton' producers in England, needed a major expansion to their existing production facilities to cope with demand they knew exactly where to turn.

JWCI had worked with the award winning Quenby Hall Dairy Ltd of Hungarton on the original build in 2005 and were the ideal candidate to take them to the next level. With many years experience in the Industry JWCI have built-up an unparalleled insight into the processes required for 'Stilton' and Blue Cheese production, because of this Quenby Hall Dairy were certain they would be able to supply the ideal solution for such a unique location.

"Quality to me is foremost and JWCI have fully delivered. They provided a superior service backed up by extensive knowledge of our Industry."

SARA STRONG, QUENBY HALL DAIRY LTD

Two types of storage, mobile and tracked racking maximising space.

The Quenby Hall Dairy Buildings are situated directly behind the spectacular Jacobean mansion of Quenby Hall. The building was extended to remain out of sight of the Hall itself to ensure the views remained unspoilt and JWCI were tasked with fitting the required equipment into this limited space.

Quenby Hall Dairy Ltd chose JWCI Ltd for major expansion work including custom design, manufacture and installation of equipment and ongoing after sales service.

JWCI's expert knowledge and client centric approach meant they initially went to site to assess the space and discuss the needs with the client. They were then able to advise on the best solution and designed, manufactured and installed equipment including a bespoke mobile racking system built to maximise space.

Additional vats and draining tables, cooling and humidity equipment, new cleaning systems, PLC integration and containerized boilers were all fitted. New control panels designed and built by JWCI and LivEarth also helped ensure efficiency of the new site once operational.

The increased facilities met every criteria specified by Quenby and allowed production to increase from 1-2 vats per day to 4-6. Having just one supplier to manage the process meant the client could focus on building their business and not on running such a time consuming project.

JWCI offer a complete package for clients. From design, manufacture and installation of all equipment, including electrical features (working in partnership with LivEarth electrical contractors) they provide a turnkey solution with high quality after sales and support packages also available.

ABOVE: An additional four coolers for the maturation stores designed, manufactured and installed by JWCI with all valves and control panels.

ABOVE: Containerized Boiler Unit manufactured off site and installed to run alongside the original small boiler.

LEFT: Control panels designed and manufactured by JWCI & LivEarth to automate different processes.

ABOVE LEFT: Work in progress at Quenby

BELOW: Equipment installed including Pasteurisers, Tanks and Hygienic Washers.

ABOVE RIGHT: From Froid Unit & associated pipe work.
